Factsheet: Large loop excision of the transformation zone (LLETZ)

What is LLETZ? A LLETZ treatment removes abnormal cells from the cervix. It is usually performed if the results of a cervical screening test (smear test) or colposcopy show moderate or severe cell changes. LLETZ is carried out using a wire loop which removes abnormal cells. Instead of looking at the cervix with the naked eye your specialist nurse or doctor (colposcopist) will use a colposcope to see changes to your cervix at high magnification.

A colposcope is a special microscope which allows a more detailed look at the cervix. It stays outside of your body; all that goes inside is the speculum. The speculum is the instrument your GP or practice nurse used to see your cervix when taking your cervical screening. You will be asked to go to a colposcopy clinic to receive your LLETZ treatment.

Some clinics perform LLETZ, if needed, when the patient is invited for colposcopy, this is called ‘see and treat’. Other clinics will ask the patient to attend colposcopy, take a biopsy and then call the patient back for a separate appointment to have the LLETZ treatment. You will be informed before the clinic visit if treatment may be offered at the first colposcopy appointment.

What happens during LLETZ?
LLETZ is performed in a clinic so you will be seen as an out-patient. LLETZ will usually not be performed if you have your period, do check with your colposcopy department if you have any concerns. The procedure should take about five minutes and is carried out with local anaesthetic. You may be asked to sign a consent form prior to treatment. If you feel concerned before or during the procedure do not hesitate to ask your colposcopist or clinic nurse for guidance or reassurance.

Most colposcopy clinics have a chair especially designed for colposcopy examinations. You will be asked to sit in the chair and your legs will be positioned on leg rests, the chair is then tilted backwards. Your colposcopist will then place a speculum in the vagina so that they can see your cervix. They will then examine your cervix using a colposcope. In many clinics, you may watch the assessment (if you wish) on a TV screen that is by your side.

During the examination the colposcopist may apply different solutions to the cervix; usually acetic acid (concentrated vinegar solution) or iodine. These solutions highlight the abnormal area(s) to be removed. Once these areas have been identified your colposcopist will inject a local anaesthetic into your cervix, using a very thin needle.

Every individual reacts differently and for some this can be a little uncomfortable. If there is still pain being felt or continued discomfort then further local anaesthetic may be administered. You must tell the colposcopist if you feel any pain.

Once the area is sufficiently numb the colposcopist will remove the abnormal area(s) with the wire loop. The loop is used to remove the abnormal tissue, usually in one piece. The area is then treated to seal any bleeding.
blood vessels. This should not be painful, however, some women can feel a degree of discomfort usually in the form of pressure or an abdominal ache, often described as similar to period pains. Some women find their legs shake as the treatment happens, if this happens do not worry it should finish after the treatment. If you feel uncomfortable during the treatment do tell you colposcopist.

Pain relief can be given if discomfort persists. It is useful to have some pain relief medication (such as you would take for period pains) in case you need to take some when you are at home. Some bleeding can be experienced immediately afterwards - this should not be heavy and the nurse will give you a panty liner to wear for your protection (you can also bring your own).

The removed tissue is sent to a laboratory for microscopic examination. The result will not be available immediately. The pathologist will report on the type of abnormality present in the loop specimen and whether the sample has ‘clear margins’ i.e. it looks as if the area of abnormality has been removed in its entirety.

You and your GP will receive a letter letting you know the results of the microscopic examination. Do check with your colposcopist or clinic nurse the length of time you will need to wait between having the LLETZ and receiving the letter.

LLETZ has been shown to be associated with a small increased risk of pre-term delivery and low birth weight in subsequent pregnancies. However, this very small risk is more than outweighed by the benefits of removing the abnormal cells from your cervix which if left untreated are at risk of developing into cancer in the future.

Will I feel OK after LLETZ?
Everyone is different; some women attend their appointments alone, have the treatment, feel OK and either return to work or go home. Others feel more reassured by bringing a family member or friend with them, who can drive them home. Some women can feel ‘washed out’ or tender afterwards and need more time to recover.

What is important is that you do what is best for you to achieve a full recovery. Some colposcopists advise their patients to take the day off and if they are feeling nervous or anxious about the treatment to take someone with them. The majority of women feel well enough to return to work the following day but some do not and need another day or two to recover.

What can I do or not do after LLETZ?
The healing process following LLETZ can differ from person to person. The cervix should heal completely within four to six weeks, but some women make a full recovery as early as three weeks. Some women find their first period after treatment can be heavier than usual. A vaginal discharge is usual for some weeks following treatment and is part of the healing process. It should stop or return to ‘normal’ as soon as the cervix is healed.

However, if it persists, becomes heavier or has an offensive smell then you should see your GP. The GP can check for any signs of infection and that healing is progressing. Occasionally antibiotics are prescribed to assist the healing process.

Follow up treatment after LLETZ treatment
It is extremely important that you attend your follow up appointment as advised by your local service after your LLETZ. Six months after your treatment you will be called back to have a repeat cervical screening test – this will usually be done at your GP surgery. In most parts of the UK an HPV test is included as part of the screening test.

These follow up tests help to identify if the LLETZ treatment has been successful, the abnormal cervical cells have been removed and the area is now normal. If the results are abnormal, you may be recalled to colposcopy. At the recall appointment, your colposcopist will let you know if you need any further check ups.

If you need some more support or further information please call the Jo’s Cervical Cancer Trust Helpline 0808 802 8000.
